

Connecting Tomcat to Eclipse

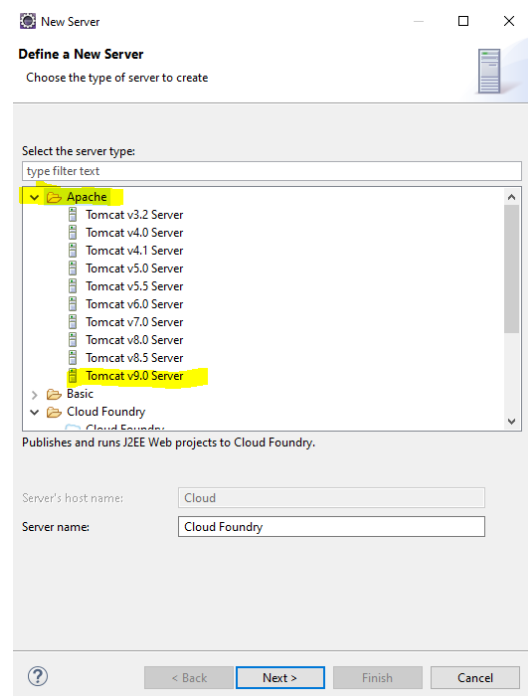

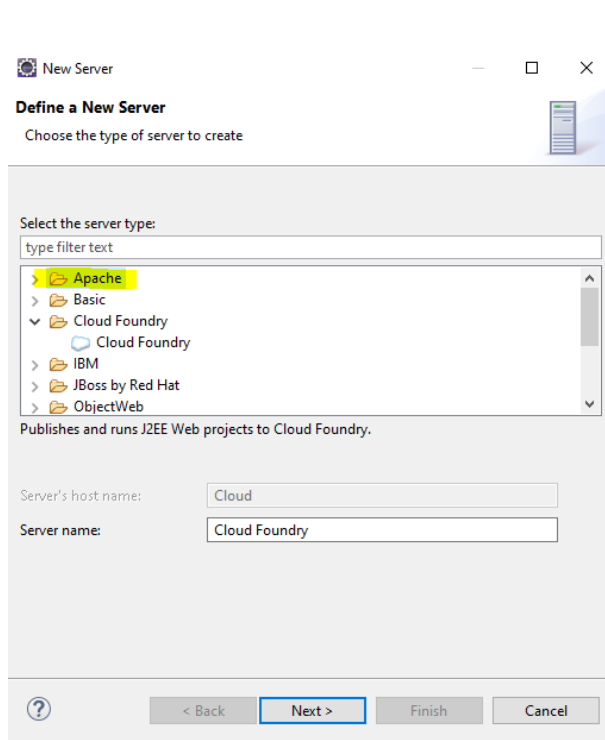

there's a tab called servers I'd like to click on that tab

at this point we don't have any servers associated with our Eclipse environment

click on the highlighted link and we're going to add a new server that points to our Tomcat that we installed previously

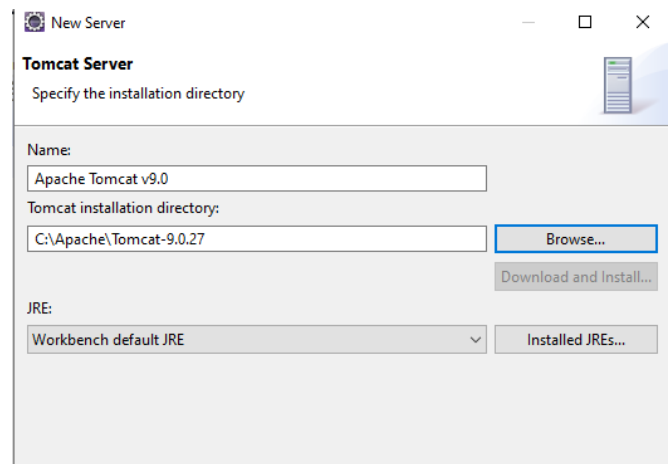

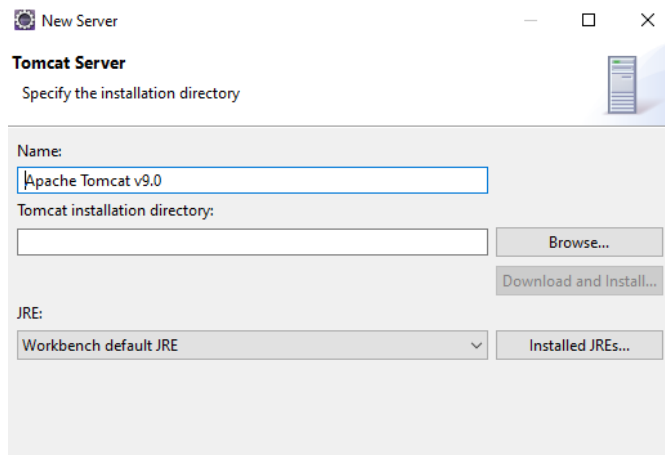

so here's the define new server what I need to do is move up to the Apache Tomcat folder and expand it

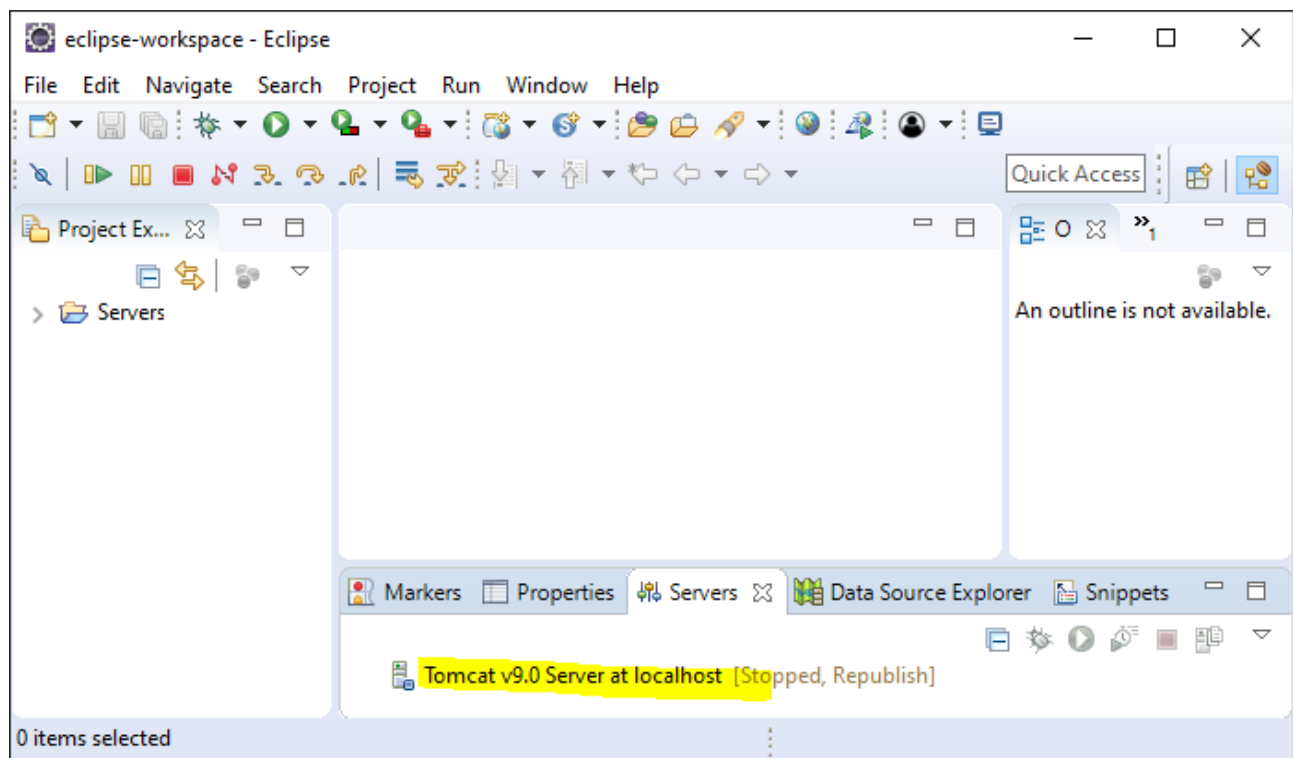

Scroll down in the list select Tomcat v9.0 Server
> Next

at this point I need to browse and tell eclipse where Tomcat is installed

click on next
>Finish

and this will associate Tomcat with the Eclipse environment

so if everything is successful down in the bottom center you should see a reference for Tomcat
now at this point it stopped we haven't started it yet
